From imagination to
blockchain in 288 clicks

\$170 million +

PRÜF lets content creators and developers launch feature rich, standards compliant tokens. The PRÜF protocol specifies a minimal set of metadata to ensure that all tokens are fully platform interoperable - Without limiting developers from extending the protocol.

Marketcapin2020

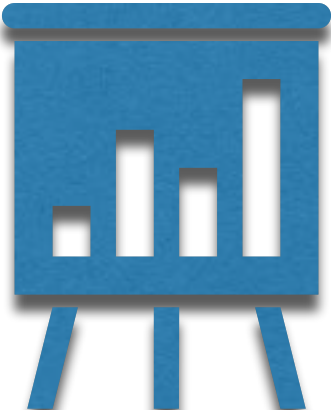

MARKET NO. 1

The NFT asset and collectible market trading volume is expected to exceed \$1bn by 2022. PRÜF can help to onboard the flood of content creators with our flexible, no-code NFT platform.

PRÜF enabled

NFTs can earn

with every interaction

PRÜF enabled NFTs have built in monetization, and can earn revenue for creators with every interaction in the system. Registrations, transfers, modifications, additions, and custom business logic are all potential revenue generating events.

+

We've been building PRÜF full time, with careful attention to security and incentive alignment. Our team consists of 4 technical founders, and more than half a century of programming expertise. The MVP web interface is in public testnet operation. The PRÜF protocol and blockchain infrastructure is audited, operational and the token is live. Watch us go.

mmRPtesters

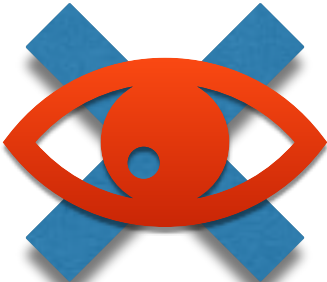

PR2PROMMERCE

With PRÜF, reselling and buying in p2p markets has never been safer. Sellers can prove ownership so that buyers can buy with confidence, and buyers can check the authenticity of PRÜF trust-enabled goods. More complex transactions, including escrows, layaways, and collateralized loans can be handled on-chain, without a third party. Ownership can be transferred on the blockchain with a token, formalizing transfer of physical or digital goods.

Tokenization with PRÜF is easy, secure and private. Only the owner of a PRÜF enabled asset can prove ownership, and PRÜF does not store personally identifiable information on the blockchain. PRÜF turns plaintext information into a cryptographic hash for blockchain storage, which cannot be reversed to obtain the original data.

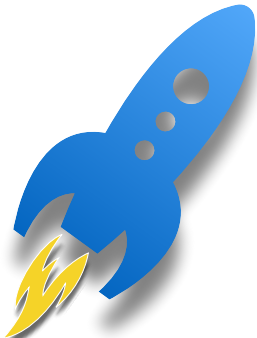

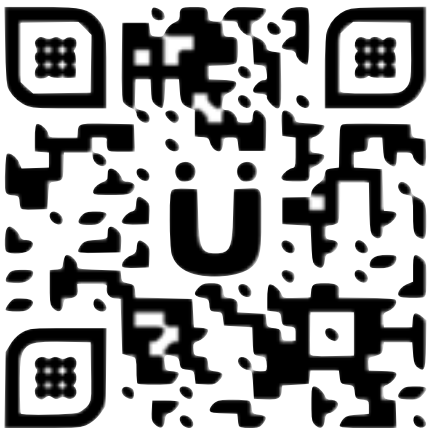

NETWORK EFFECTS

PRÜF lets content creators and developers launch feature-rich, self monetizing, standards-compliant tokens without writing any contract code. Providing a basic set of standards that cover the most common feature requirements while allowing infinite extensibility in a standardized way facilitates the growth of a rich ecosystem of interoperable tools and platforms without limiting developers.
